1. INTRODUCTION

1.1. CONTEXT OF THIS DOCUMENT

This document is written for French CSPN¹ scheme certification for “*Simatic S7-1518-4*”. This product is implemented by **Siemens**.

This security target is **compliant** to the ANSSI² protection profile of an industrial programmable logic controller (version 1.1 short term).

1.2. PRODUCT IDENTIFICATION

Editor	SIEMENS AG Industry Sector – Drive Technologies Division Gleiwitzerstr. 555 90325 Nürnberg GERMANY
Link	http://www.siemens.com
Product	Simatic S7-1518-4 TOE managed with TIA Portal V13+SP1 // WinCC V13+SP1
Firmware version	V1.83
Product category	Programmable Logic Controller

Table 1 - Evaluated product identification

1.3. REFERENCES

For the security target, these documents have been used:

2. PRODUCT DESCRIPTION

2.1. GENERAL DESCRIPTION

A programmable logic controller (PLC) is a device designed for controlling and commanding an industrial process, in a continuous way, without human intervention. At each step, a PLC processes the data received from its inputs, the sensors and sends commands to its outputs, the actuators.

In addition to standard references, there are two types of PLCs:

- redundant PLCs, used for higher availability of ICS,
- safety PLCs, used for ensuring safety of people and assets.

The PLC must be able to run in a hostile environment. In particular, it must run despite humidity, dust or unusual temperatures for IT systems.

The considered target of evaluation (TOE) is the *Simatic S7-1518-4* (CPU-1517 and CPU-1518) developed by **Siemens**.

The TOE is managed with TIA Portal V13+SP1 // WinCC V13+SP1.

Figure 1 - Simatic S7-1500 illustration

2.2. FEATURES

The TOE includes the following features:

- **User program execution:** the TOE runs a user program. This program processes the inputs and updates the outputs.
- **Input/output management:** the TOE is able to read local or remote inputs and to write local or remote outputs. These I/O can be digital or analog. These I/O allows the TOE controlling and commanding the industrial process.
- **Communication with the supervision:** the TOE can communicate with the SCADA for receiving commands and transmitting process data.

- **Administration functions:** the TOE includes administration functions in order to configure, or program the other functionalities of the TOE. Several administration interfaces are possible:
 - o thick-clients (sometimes also called, depending on the context, administration console, programming workstation...)
 - o web-clients
 - o removable devices (USB drives, SD memory cards, etc.)
- **Local logging:** the TOE supports the configuration of a local logging policy. It is possible, in particular, to log security and administration events.
- **Remote logging:** the TOE supports the definition of a remote logging policy. In particular, it is possible to log security and administration events.

2.3. PRODUCT USAGE

A PLC can be used in diverse architectures but a general framework can be characterized. The PLC is connected to inputs and outputs and to its local HMI through the same communication interface on the field network. Exchanges with the supervision (HMI, SCADA) are performed through a dedicated interface on the supervision network.

The PLC is managed with an engineering workstation. Firmware updates and user programs can, in general, be loaded on the PLC through the network, thanks to a serial bus or a removable device (SD memory cards).

In the case of a network maintenance, the use of a dedicated network is recommended. This network should be physically isolated from other networks or, at least, logically isolated. In practice, an engineering workstation is often plugged on the supervision network. This engineering workstation should not be permanently plugged but only when it is necessary.

This basic architecture is depicted on Figure 2.

Figure 2 - Typical network architecture for a PLC

3. SECURITY PERIMETER

3.1. USERS

The users that may interact with the TOE are the following:

- **Operator:** This user can access the TOE data with read-only privileges.
- **Technician:** This user has the same privileges as the previous one and he can also modify some variables in the TOE.
- **Automation Engineer/administrator:** This user has maximal privileges. He can, in particular modify the user program and update the firmware of the TOE. In some cases, this type of user is called "developer".

Remark: a user is not necessary a human being, it may be a device or a third-party software. Moreover, the same person may own several user accounts corresponding to different profiles.

3.2. ASSUMPTIONS

Assumptions on the environment and the use case of the TOE are the following:

- **Logs checking:** we assume that administrators check regularly the local and remote logs produced by the TOE.
- **Administrators:** TOE administrators are competent, trained and trustworthy.
- **Premises:** The TOE is located in secure premises with a restricted access limited to trustworthy people. In particular, the attacker does not have access to the physical ports of the TOE.

Since identical products to the TOE may be purchased freely, the attacker may purchase one in order to research vulnerabilities by any possible mean.

- **Active logging:** We assume that local and remote logging are operational and that local logs are not corrupted.
- **Unevaluated services disabled by default:** services of the TOE which are not covered by the security target are disabled in the default configuration (also named factory default configuration).
- **Security documentation:** the TOE is provided with a complete documentation for a secure usage. In particular, all secrets are listed in order to allow their customization.

These documents are as follows:

- o <https://support.industry.siemens.com/cs/ww/en/view/71704272>
- o <https://support.industry.siemens.com/cs/ww/en/view/109481357>
- o <https://support.industry.siemens.com/cs/ww/en/view/86140384>
- o <https://support.industry.siemens.com/cs/ww/en/view/68052815>
- o <https://support.industry.siemens.com/cs/ww/en/view/59191792>

All recommendations included in this documentation are applied prior to the evaluation.

3.3. CRITICAL ASSETS

3.3.1. Critical assets of the environment

The critical assets of the environment are the following:

- **Control-command of the industrial process:** the TOE controls and commands an industrial process by reading inputs and sending commands to actuators. The availability and integrity of these actions must be protected.
- **Engineering workstation flows:** the flows between the TOE and the engineering workstation must be protected in integrity and authenticity.

The security requirements for the critical assets are the following:

Assets	Availability	Confidentiality	Integrity	Authenticity
Control-command of the industrial process	X		X	
Engineering workstation flows			X	X

3.3.2. TOE critical assets

The critical assets of the TOE are the following:

- **Firmware:** in order to work properly, the firmware must be protected both in integrity and authenticity.
- **User program:** the TOE runs a program written and loaded by the users. Its integrity, confidentiality and authenticity must be protected.
- **Configuration:** the configuration of the TOE must be protected in confidentiality and integrity. The attacker must not be able to discover the configuration of the TOE by other means than the TOE activity.
- **Execution mode:** the integrity and authenticity of the execution mode of the TOE must be protected.
- **User authentication mechanism:** this mechanism can be based on a local database or on a remote authentication server. In both cases, the TOE must ensure the integrity and authenticity of the mechanism³.
- **User secrets:** the user secrets can be passwords, certificates...They can be stored in the TOE or stored in a remote authentication server. In all cases, the TOE must ensure the integrity and confidentiality of these credentials.
- **Access control policy:** the policy can be stored locally or remotely on an authentication server. In both cases, the TOE must ensure the integrity of the access control policy.

³ All authentication mechanisms offered by the TOE may not necessarily be part of the security target. However, those which are not included in the security target must be disabled by default.

The security requirements for the critical assets are the following:

Assets	Availability	Confidentiality	Integrity	Authenticity
Firmware			X	X
User program		X	X	X
Configuration		X	X	
Execution mode			X	
User authentication mechanism			X	X
User secrets		X	X	
Access control policy			X	

3.4. THREAT MODEL

3.4.1. Attackers

The following attackers is considered:

- **Attacker on the supervision network:** the attacker controls a device plugged on the supervision network of the TOE.

3.4.2. Threats

The following threats are considered:

- **Denial of service:** the attacker manages to generate a denial of service on the TOE by performing an unexpected action or by exploiting a vulnerability (sending a malformed request, using a corrupted configuration file...). This denial of service can affect the whole TOE or only some of its functions.
- **Firmware alteration:** the attacker manages to inject and run a corrupted firmware on the TOE. The code injection may be temporary or permanent and this does include any unexpected or unauthorized code execution.

A user may attempt to install that update on the TOE by legitimate means.

Finally, the attacker manages to modify the version of the firmware installed on the TOE without having the privilege to do so.

- **Execution mode alteration:** the attacker manages to modify the execution mode of the TOE without being authorized (a stop command for instance).
- **User program compromise:** the attacker manages to obtain some parts of the configuration of the TOE by other means than the observation of the activity of the TOE.
- **User program alteration:** the attacker manages to modify, temporarily or permanently, the user program.
- **Configuration alteration:** the attacker manages to modify, temporary or permanently, the TOE configuration.
- **Configuration compromise:** the attacker manages to illegally obtain some parts of the TOE configuration.

- **Credentials theft:** the attacker manages to steal user credentials.
- **Authentication violation:** the attacker succeeds in authenticating himself without credentials.
- **Access control violation:** the attacker manages to obtain permissions that he does not normally have.
- **Flows alteration:** the attacker manages to corrupt exchanges between the TOE and an external component without being detected.
- **Flows compromise:** in case of data flows requiring confidentiality, the attacker manages to fetch data by intercepting exchanges between the TOE and an external component.

3.5. SECURITY FUNCTIONS

The following security objectives are considered:

- **Malformed input management:** The TOE has been developed in order to handle correctly malformed input, in particular malformed network traffic.
- **Secure storage of secrets:** User secrets are securely stored in the TOE. In particular, the compromise of a file is not sufficient for retrieving them.
- **Secure authentication on administration interface:** Session tokens are protected against hijack and replay. They have a short lifespan. The identity and the permissions of the user account are systematically checked before any privileged action.
- **Access control policy:** The access control policy is strictly applied. In particular, the implementation guarantees the authenticity of privileged operations, i.e. operations that can alter identified critical assets.
- **Firmware signature:** At each update of the firmware, the integrity and authenticity of the new firmware are checked before updating. The integrity and authenticity of the firmware are also checked at boot time.
- **Configuration confidentiality and integrity:** The access control prevents any unauthorized person to read or modify the configuration of the TOE.
- **Integrity and authenticity of the user program:** The TOE ensure the integrity of the user program. Only authorized users can modify it.
- **Confidentiality of the user program:** The TOE protects the confidentiality of the user program. Only authorized users can access it.
- **Integrity and authenticity of commands and PLC mode:** The TOE must ensure that the execution mode of the TOE can only be modified by authorized users. This implies, in particular, that they are authenticated.
- **Secure communication:** The TOE supports secured communication, protected in integrity and authenticity. If required, confidentiality is enforced with external components.
